

Sample Data & Trends

The figure consists of four vertically stacked line charts sharing a common x-axis representing time from 17 Sep 2020 to 13 Oct 2025. The y-axis for all charts ranges from 0 to 6.4 (Viscosity), 0 to 40 (Wear), 0 to 60 (Contaminants), and 0 to 4 (Physical Properties).

- Viscosity:** Shows Visc@100C (cSt) for Ag (Silver). The values start at 6.2, remain constant until 26 Jul 2021, peak at 6.3 on 08 Feb 2023, and then decrease to 6.1 by 13 Oct 2025.
- Wear:** Shows wear for Ag (Silver), Al (Aluminum), Cr (Chromium), Cu (Copper), Fe (Iron), Ni (Nickel), Pb (Lead), and Sn (Tin). Fe (Iron) shows the highest wear, peaking at 40 on 27 Dec 2023. Ni (Nickel) also shows significant wear, peaking at 18 on 27 Dec 2023. Other materials show low wear values.
- Contaminants:** Shows the concentration of Na (Sodium), K (Potassium), and Si (Silicon). Si (Silicon) shows the highest concentration, peaking at 40 on 27 Dec 2023. Na (Sodium) and K (Potassium) show low concentrations.
- Physical Properties:** Shows Oxidation (Ab/cm) and Water (Vol.%) for Ag (Silver). Oxidation (Ab/cm) starts at 1, remains constant until 08 Feb 2023, peaks at 3 on 27 Dec 2023, and then decreases to 2 by 13 Oct 2025. Water (Vol.%) remains constant at 0 throughout the period.
